

I believe this bill needs to be strengthened.

I am fortunate to own a house with a good orientation. I am leasing a 38-PV-panel system which works as advertised. Over the course of a year, I generate almost all the current I use.

However, most Connecticut residents cannot access solar. Either they don't own their own house or their roof-line is not conducive to PV panels. Shared solar is the only sustainable option in such cases.

The current pilot program is already delayed and inadequate. Other states, such as Massachusetts and Maryland, are way ahead of us on this.

More solar creates jobs, helps the economy and the environment. This is also a public-health issue: we need to breathe clean air!

*Connecticut should immediately drop the pilot program and authorize unlimited shared solar without limiting the number of projects or total megawatts (Public Act 15-113). There is no need for just a small pilot program.
